I've got this problem with one of my VEs during software installation, after rebooting the server. There are more VEs running different software on the same hardware node and working well, this VE in particular seems also to be working well (I can ping it, use SFTP, etc.) but I can't enter it using vzctl enter (I get this result) or using ssh to access it (in that case it hangs after entering the password). I strace the vzctl enter and attached the result file. This is the second time this happens, always installing the same software (Erlang from source), installing also the "Development Tools" group in the VE using yum to be able to compile Erlang. Both host and VE OS is CentOS 5. It seems I'm making something wrong, but I can't figure what is it, so if you have any clue, it will be much appreciated!

Thanks!

Fernando
