After installing the kernel I seem to get stuck in the following dependencies.. any idea how to satisfy them?

#rpm -ivh vz*
    vzkernel is needed by vzctl-3.0.0-4.i386
    vzquotamod is needed by vzquota-3.0.0-2.i386

#rpm -ivh ovzkernel-2.6.8-022stab072.2.i686.rpm vz*
error: Failed dependencies:
    kernel < 2.6.9 conflicts with glibc-2.4-4.i686
    kernel < 2.6.12 conflicts with initscripts-8.31.1-1.i386
    kernel < 2.6.11 conflicts with hal-0.5.7-3.i386
    kernel < 2.6.13 conflicts with kudzu-1.2.34.3-1.i386

We're awfully sorry, looks like latest OpenVZ FC5 kernel does not provide vzkernel and vzquotamod as it should. I have filed bug #134; you can add yourself to Cc for that bug to track its progress.

For now, install vzctl and vzquota using --nodeps flag to the rpm. Again, sorry for the inconvenience. Will be fixed in the next FC5 kernel.

What about the kernel dependencies. I have the same exact deps issues while trying to install ovzkernel-smp-2.6.8-022stab078.10.i686.rpm:

error: Failed dependencies:
    kernel < 2.6.9 conflicts with glibc-2.4-4.i686
    kernel < 2.6.12 conflicts with initscripts-8.31.1-1.i386
    kernel < 2.6.11 conflicts with hal-0.5.7-3.i386
    kernel < 2.6.13 conflicts with kudzu-1.2.34.3-1.i386

What are the ramifications of forcing this install. Seems scary to force a glibc dep, but I think it might be okay.

Can someone shed some light?

Thanx.

it is mostly ok to force it.
most of these dependencieas for hardware-related applications, but nothing bad will hapen if
kudzu won't find your new modern sound card which is anyway disabled by default in our kernels
