Hello,
 I noticed that some of ips are sometimes disappearing from my host,
on HN it looks like this:

```
devamd:# vzlist
   VPSID    NPROC STATUS  IP_ADDR        HOSTNAME
   1002        4 running 192.168.89.106  -
   1003        4 running 192.168.89.107  etchdev386
   1004        4 running 192.168.89.108  etchdevamd64
```

but those ips are unavailable, ping doesn't work, so I check the routing:

```
devamd:# ip r
192.168.89.0/24 dev eth3  proto kernel  scope link  src 192.168.89.105
default via 192.168.89.1 dev eth3
```

I think it shouldn't look like this, so I try such sequence:

```
 devamd:~# vzctl set 1004 --ipadd 192.168.89.108
 Adding IP address(es): 192.168.89.108
 Unable to add IP 192.168.89.108: Address already in use
```

strange, if it's in use then where can I see that?.. so:

```
 devamd:# vzctl set 1003 --ipdel 192.168.89.107
 Deleting IP address(es): 192.168.89.107
 vps-net_del WARNING: Function proxy_arp for eth3 is set to 0. Enable with 'sysctl -w
net.ipv4.conf.eth3.proxy_arp=1'. See /usr/share/doc/vzctl/README.Debian.
WARNING: Settings were not saved and will be resetted to original values on next start (use
--save flag)
```

```
 devamd:# vzctl set 1003 --ipadd 192.168.89.107
 Adding IP address(es): 192.168.89.107
 vps-net_add WARNING: Function proxy_arp for eth3 is set to 0. Enable with 'sysctl -w
net.ipv4.conf.eth3.proxy_arp=1'. See /usr/share/doc/vzctl/README.Debian.
WARNING: Settings were not saved and will be resetted to original values on next start (use
--save flag)
```

and then it looks like this:

```
devamd:# ip r
192.168.89.107 dev venet0  scope link  src 192.168.89.105
192.168.89.0/24 dev eth3  proto kernel  scope link  src 192.168.89.105
```

default via 192.168.89.1 dev eth3

is there a reason why such disappearing act should happen? (I'm running
fairly minimal debian etch on HN, there's only vzctl and few things like
mtr, screen installed, nothing should be touching networking)

 this is my only amd64 machine using venet, on i386s with almost identical
setup I haven't noticed anything similiar

this can happen if some hotplug/udev event has happened and removed the routes
in host node. check /var/log/messages for any kind of events like eth link DOWN/UP,
DHCP lease reacquiring etc.

You can also replace ip and route utilities with some wrapper which logs who
and when removes the routes and find the one to blame.

Thanks,
Kirill

 I can't find anything like that, BUT I can correllate those events (ie
direct route entries in route table disappearing) with network problems,
but this shouldn't be visible to the host (things like upstream provider
loosing link, snow severely slowing down radio uplink etc).

This seems strange, and identical routes created by hand, and not by vz
stay in place. This looks very much like vz is doing this, so this mail is
a broadcast - did anyone else see something like this or something
similiar?

 The funny part is that it happens only on freshly installed dev machine
and not on machines I'm actually using;)

Hm... this is quite interesting...

Does it often happens?
I'm aware only of 2 places where routing can be removed:
1. hotplug, which I mentioned already.
   maybe some other "clever" daemon running on your system?
   RIP/OCFS?
2. OVZ crontab sript which should delete dead routes.
   can you check this one as well?

All I can suggest for debugging is to:
1. replace ip and route commands with a wrapper which logs the exact
   commands and when/who called them.
2. add similar debug to kernel.

BTW... does your host system uses DHCP or static IP assigned?

Thanks,
Kirill

 aaah, now that you mention it, this is the only dhcp-configured machine
with openvz I've got around... and today I disabled DHCP server and few
hours later noticed the problem with openvz.
 This might be it, and it would explaing non-immediate connection with
networking problems. Thanks.

Yep. DHCP client tries to be too smart :/
I've added this KB:
http://wiki.openvz.org/Networking:_disappering_routes_in_HN

Thanks,
Kirill
