Here's what gets out from a make-kpkg (on debian):

```
  LD      init/built-in.o
  LD      .tmp_vmlinux1
arch/x86_64/kernel/built-in.o: In function `alloc_ldt':
/tmp/linux-2.6.18/arch/x86_64/kernel/ldt.c:50: undefined reference to `ub_kmalloc'
mm/built-in.o: In function `out_of_memory':
/tmp/linux-2.6.18/mm/oom_kill.c:353: undefined reference to `show_slab_info'

Hi,

1. Can you please thoroughly describe how you get your source? (step by step).
2. Have you change it manually or applied any external patch?

Thank You!

Sure.
1. I get the source downloading the 2.6.18 tarball from the main kernel site. Then I download the ovz patch (as I've always done and as it works on the x86 arch) and apply it. It applies without any problem. Then I get the old 2.6.18 .config file, I type a "make oldconfig" and put some missing variables (like the grsecurity support).
After this I just give a "make-kpkg --initrd kernel-image kernel-headers" and, after some compiling, it stops with that error.
Performing a normale "make" gives the same result.
No other patches have been applied.

Thank you!

Hi,

can you please post your kernel-config,
or use a OpenVZ kernel-config (-> http://download.openvz.org/kernel/branches/2.6.18/stable/configs/) and edit it.
