is it reproducible on your configuration?
I will ask someone to check it.

Which kernel version do you use?

Afrer server rebooting all is clear. But if there are some VPSs under loading (8 in my case against Apache benchmark testing) this problem appears in dmesg.
If it is one VPS overriding allocated resources (I check it in /proc/user_beancounters) then a very big problem appears. VPS is hang, I cannot stop it (timeout is out), I cannot stop /etc/init.d/vz - the same reason, I cannot properly reboot the server - I think the same => the whole server is hang .

which resource hit leads to this? any or some specific?

Subject: Re: Is a BUG in SUSE10 kernel?

[View Forum Message](#) <> [Reply to Message](#)

- kmemsize when I started Apache on basic VPS;
- privvmpages when ntpd on light VPS.

In both cases I used default configuration first. It's not valid from vzcfgvalidate view => changing it upto success validate solved the problem in first case, it seems.

smsprog, can you build the kernel yoursef? If you do, I can provide you with debugging patch to clarify what's going on.

PM - private message.

I've sent a patch. There may not be BUG, but "Bad page on..." message in dmesg. Don't miss it

I've made a patch. Please, try it, but don't remove my debuggind patch.

You may see the patch here:

<http://git.openvz.org/?p=linux-2.6-openvz;a=commitdiff;h=287b9a41a85772a69ddc353afef2c448d6ed8ce3;hp=7bd802cb2daca45a6d490e4718f0e292e28c5285>

or download a plain one here:

http://git.openvz.org/?p=linux-2.6-openvz;a=commitdiff_plain;h=287b9a41a85772a69ddc353afef2c448d6ed8ce3;hp=7bd802cb2daca45a6d490e4718f0e292e28c5285

There weren't any like problems in dmesg after weekends. But I got another one. I had 8 VPS with Apache+Postgres+php site. There was a disk quotas overriding by internal reason: about 60'000 short files on each VPS. I stoped all VPS, /etc/init.d/vz and tried to remove all these files (by mc). First 2 VPS were success. At third I got a server hanging .

Last messages in log are:

Apr 16 16:11:14 virt kernel: ReiserFS: md1: warning: vs-5355: reiserfs_delete_solid_item: [59953 64236 0x0 SD] not found

After rebooting I found errors on /dev/md1.

Then I have a very strange things with time (it seems 2 hours in past during kernel boot??):

virt:~ # last

root pts/0 XXXXXXXXXXXXXXXX Tue Apr 18 10:16 still logged in

reboot system boot 2.6.16-026test00 Tue Apr 18 12:16 (-1:-54)

smsprog,

1. I personally don't recommend using reiserfs ./ We had enough "fun" supporting this But if you use it, don't forget to report problems to Linux Kernel Mailing List (LKML), to make people aware of it's bugs (as we are very unlikely to be able to help with reiser).

2. about time. Do you have AMD or Intel? Can you check if time is going fast/slow during the day? If it is noticable, try booting with 'noapic' or 'clock=pmtmr'.

it's ok. fairsched is not in 2.6.16 yet.

the only feature. will be added soon.

Now I again have big problem. The server was hanging after web benchmarking. There is nothing in logs after reseting.

The uptime before was about 1 month.

Now I have a way to install new kernel realeased on 19 May (the day of hanging by the way).

I have 3 questions:

1. Is OpenVZ kernel for SUSE10 stable enough or it's beta?
 2. Is OpenVZ kernel for Fedora more stable than for SUSE10?
 3. What is to do for kernel troubleshooting? I've read all Guides - there are nothing useful for me.

I would recommend stock 2.6.16 or 2.6.8.

Was there anything on the screen or you have no access to it?

Can you install serial on net console? This will help us to get kernel messages if something fails.

Check this HOWTO: <http://wiki.openvz.org/Troubleshooting>
