Hi,  
I am currently trying to use a NFS Server  
to share the private area between different  
HNs.  
I am using debian etch with systs.org repo  
(tried fza and standard kernel-image).  
I am using standard debian kernel as nfs host.  
It seems possible to get VEs working, but  
'df -h' cant show root file system simfs.  
Also apt-get wont run because of a statvfs error  
( 'No such Device', if I remember correctly.  
I want to know if this is a nfs or openvz specific  
problem, and if somebody else encountered the same problem.  
are there any recommendations to share private data  
between Hosts? Are there other (simple to manage)  
network-filesystems that are usable?  
I am trying to share private areas to minimize  
migration time.

Thanks and best regards, Moritz.

Hi,  
I am sorry to push up that thread again, but:  
I really need a clue how to get this working!  
I really need the Live-Migration for a Linux-  
Terminal-Server-Project like setup.  
Is there somebody out there using the Live-  
Migration feature of OpenVZ, if so  
how do you share the private Areas of the VEs?

Has somebody a clue on where to look at to solve  
the NFS Problem? I am not afraid of code...

Thanks again, Moritz

I'm having a similar problem, I have two HNs and am trying to move the VEs to an NFS storage. NFS is a QNAP NAS, HEs are running up-to-date Lenny with latest openvz kernel. I mounted the NFS under /var/lib/vz on the target HN, and tried to migrate a VE containing a webserver to it with `vzmigrate -r no --keep-dst -v target-vz VEID`

It seems to migrate fine and the VE starts on the target, but when I try to access the website I get a 403 error and this message in /var/log/apache2/error.log: Permission denied: /.htaccess  
pcfg\_openfile: unable to check htaccess file, ensure it is readable

The file in question seems readable (755). The site works fine on the original HN. Any ideas what's going on?

[UPDATE] Never mind, private directory had 700 permissions, changing it to 755 fixed it.
