Cannot use iptables in VPS under SUSE10 OpenVZ kernel.

```
virt1:~ # iptables -L -n -v -x
```

```
Chain INPUT (policy ACCEPT 255 packets, 19625 bytes)
```

```
  pkts  bytes target  prot opt in  out  source  destination
```

```
Chain FORWARD (policy ACCEPT 0 packets, 0 bytes)
```

```
  pkts  bytes target  prot opt in  out  source  destination
```

```
Chain OUTPUT (policy ACCEPT 162 packets, 18750 bytes)
```

```
  pkts  bytes target  prot opt in  out  source  destination
```

```
virt1:~ # iptables -A INPUT -p tcp --dport 80 -j ACCEPT
```

```
iptables: No chain/target/match by that name
```

All necessary modules are uploaded in kernel.

```
virt:~ # lsmod |grep ip
```

```
ipt_ttl          6528 7
```

```
ipt_TCPMSS       8704 7
```

```
iptable_mangle   8704 8
```

```
iptable_filter   8576 9
```

```
ipt_multiport    7168 14
```

```
ipv6             243008 18
```

```
ipt_tos          6272 7
```

```
ipt_REJECT       9728 8
```

```
ip_tables        18260 2 iptable_mangle,iptable_filter
```

```
x_tables         20480 10 xt_tcpudp,xt_length,ipt_ttl,xt_tcpmss,ipt_TCPMSS,ipt_multiport,xt_limit,ipt_tos,ipt_REJECT,ip_tables
```

```
virt:~ # tail /etc/sysconfig/vz-scripts/101.conf
```

```
....
```

```
IPTABLES="iptables_filter iptable_mangle ipt_limit ipt_REJECT ipt_length "
```

The same VPS been migrated on ovz kernel can use iptables. Is it a SUSE10 OpenVZ kernel problem?

This problem affects all our 2.6.16 based kernels. Module xt_tcpudp, which is responsible for '-p tcp' option is new and its code was included in previous kernels to ip_tables module. Will be virtualized and fixed in next kernels.
