Hi anyone there, I have just using RPM to install the kernel 2.6.8-022stab076.1 on my IBM x305 server with CentOS 4.3 running properly.

But it have the warning "No module aic7xxx found for kernel 2.6.8-022stab076.1". Is there anything wrong out there or I could just ignore the message and then follow the instruction from the guide and reboot with this kernel ?

Don't worry. this driver is builtin into kernel. So no module is found.
