there is no way of saying that you want X of Ram and Y of Swap. You say you want Z of virtual memory and openvz will manage it between ram and swap...

hope this clarifies things up for you

Ok how ican do that any file need to changed
i have install at my server swap 30 g and real ram 16 g

how ican config them

VMGUARPAGES="32768:2147483647" // 128MB Guaranteed
VMGUARPAGES="65536:2147483647" // 256MB Guaranteed
VMGUARPAGES="131072:2147483647" // 512MB Guaranteed

PRIVVMPAGES="64000:65536" // 256MB Burst
PRIVVMPAGES="128000:131072" // 512MB Burst
PRIVVMPAGES="256000:262140" // 1024MB Burst

guaranteed is the minimum amount of virtual memory your vps has in a normal situation.
burst is the amount of memory your server will be able to use if there is enough available...

just multiply to get the values you want.

hope it helps

Thx you very much sir i will test them now and get back to you.
what about

512 MB Ram Guaranteed
620 MB Burstable Ram

1 Guaranteed Ram
1500 Burstable Ram

Well here is a little tutorial on how to create a VPS:

```
#change to the dir where you have your templates
cd /var/lib/vz/template/cache

#get the template from the openvz site
wget http://download.openvz.org/template/precreated/[filename]
# create with the template you have downloaded
vzctl create [number] --ostemplate debian-3.1-i386-minimal --config vps.basic
# set onboot to boot the VPS on server boot
vzctl set [number] --onboot yes --save
# set vps hostname
vzctl set [number] --hostname hostname.org --save
#set ip
vzctl set [number] --ipadd 192.168.1.130 --save
#set number of sockets (may not be needed)
vzctl set [number] --numothersock 120 --save
#set the ip of a dns server (local or on the internet)
```

```
vzctl set [number] --nameserver 192.168.1.130 --save
# start vps
vzctl start [number]
#set root password
vzctl exec [number] passwd
```

hope this helps

I will try and get back to you but thx you very much it is very easy

what it is best way for create --config vps
Current CPU utilization: 1000
Power of the node: 808993

```
VMGUARPPAGES="32768:2147483647" // 128MB Guaranteed
PRIVVMPAGES="64000:65536" // 256MB Burst
```

```
VMGUARPPAGES="65536:2147483647" // 256MB Guaranteed
PRIVVMPAGES="128000:131072" // 512MB Burst
```

```
VMGUARPPAGES="131072:2147483647" // 512MB Guaranteed
PRIVVMPAGES="256000:262140" // 1024MB Burst
```

```
VMGUARPPAGES="262144:2147483647" // 1GB Guaranteed
PRIVVMPAGES="384000:393212" // 1,5GB Burst
```

Thx you for your time....

Hi powervps

Can you please explain to me how you got the figures?
I want to set a VPS with 512MB guaranteed RAM, and 1024 burst.

So, I used your example, but free -m shows me something odd:

```
[root@gandalf ~]# vzctl set 1001 --privvmpages=256000:262140 --save
UB limits were set succesfully
Saved parameters for VE 1001
[root@gandalf ~]# vzctl set 1001 --vmguarpages=131072:2147483647 --save
UB limits were set succesfully
Saved parameters for VE 1001
[root@gandalf ~]# vzctl restart 1001
Restarting VE
Stopping VE ...
VE was stopped
VE is unmounted
Starting VE ...
VE is mounted
Setting CPU units: 1000
Configure meminfo: 256000
Set hostname: vps03.softdux.com
File resolv.conf was modified
VE start in progress...
[root@gandalf ~]# vzctl exec 1001 free -m
```

total	used	free	shared	buffers	cached
-------	------	------	--------	---------	--------

Mem:	1000	171	828	0	0	0
-/+ buffers/cache:		171	828			
Swap:	0	0	0			

Why does the total say 1000, and not 1024, or for that matter 512?

Subject: Re: Howto config ve of ram 1GB
Posted by [blunt](#) on Sat, 12 Apr 2008 09:59:11 GMT
[View Forum Message](#) <> [Reply to Message](#)

You used these values:

```
VMGUARPAGES="131072:2147483647" // 512MB Guaranteed  
PRIVVMPAGES="256000:262140" // 1024MB Burst
```

free -m shows you the soft limit on burstable ram, which is 256000 (1000MB). The hard limit, the one which you cannot pass is the hard limit (262140 - 1024MB). If you wish, you can set the soft limit equal to the hard limit, both with 262140, and free should say it has 1024MB. free will never show 512MB of ram, unless your hardware node is crowded and there is not enough space for everyone.

Hope this helps.

[View Forum Message](#) <> [Reply to Message](#)

ok, that makes sense.

So, If I sell a VPS with 512 gauranteed & 1024 burst, the user will see 1000MB when he uses free -m to check the memory, or even in cPanel's "Server Information" - can / does this cause a problem?

Subject: Re: Howto config ve of ram 1GB
Posted by [blunt](#) on Sat, 12 Apr 2008 23:21:25 GMT
[View Forum Message](#) <> [Reply to Message](#)

that is up to your clients...

If you want to avoid problems, just set the soft and hard limit to the hard limit values, and the users will see the 1024MB instead of the 1000MB
