hello,
excuse me, i installed openvz on server and i create a vps , i ant to install cpanel on vps but when i enter : wget http://layer1.cpanel.net/latest

i see this error :
[root@server home]# wget http://layer1.cpanel.net/latest
--03:58:59-- http://layer1.cpanel.net/latest
=> `latest'
Resolving layer1.cpanel.net... failed: Temporary failure in name resolution.

please help me

Hi,

1. Have you set DNS server for your VPS? (If no please look at "man vzctl" page --nameserver parameter).
2. Is this persistent problem? Try to wget again.

Thank You!

yes,
i set 2 nameserver in /etc/resolv.conf but i have the same problem

thanks

Hi,

1. Can you ping something from inside the VE? For example
#ping google.com
2. Can you please attach the result of
strace -f -o filename wget http://layer1.cpanel.net/latest
3. Can you please show the output
cat /proc/user_beancounters

Thank You!

```
[root@server ~]# ping google.com
ping: unknown host google.com
[root@server ~]# strace -f -o filename wget http://layer1.cpanel.net/latest
-bash: strace: command not found
[root@server ~]# cat /proc/user_beancounters

```
cat /etc/resolv.conf
```

i recommend you change the config files of the VPS so it uses that values automatically. The config files are inside: /etc/sysconfig/vz-scripts and the entry is call: NAMESERVER="10.0.80.11" You can changed + add whatever nameserver you want, then you need to restart the vz so the effect to change. After this is done, it will for ever use the correct info, and you will not need to change them ever again.

Hi,

you can use vzctl to set appropriate nameserver.

Just type the command:

```
vzctl set <VEID> --nameserver <IP> --save
```

where is:

<VEID> - your VE ID

<IP> - appropriate nameserver IP

P.S.

If it will be impossible to ping google.com after this command check if it is possible to ping it using it IP address or please try to use this nameserver

```
vzctl set <VEID> --nameserver 4.2.2.4 --save
```

Thank You!

Look where you have create a vps

```
vzctl start 101
```

```
vzctl enter 101
```

```
nano /etc/resolv.conf
```

```
#if you dont have nano you can using vi or download nano for vps 101
```

```
vzyum 101 install nano
```

```
enter Y
```

normal is 127.0.0.1 delet it and past

```
nameserver 4.2.2.1
```

```
nameserver 4.2.2.2
```

reboot vps 101 than all will work

hello,
excuse me, i cant understand from openvz manual (pdf) for memory (ram) limits,
can you please give me an example of creating a vps with min 256 mb ram and max 512 mb , min
200 mgz cpu and max 400 mgz , bandwidth 300 gb, and space 30 gb ,

thanks
