today i made a discover:
in my VE i saw a ssh-connection, which is shown in "ps aux" as following:
root   25675 0.0 0.1 5868 1960 ?   Ss 15:58 0:00 sshd: [accepted]

I think it is a process in another VE because i did not find the information about it. Now I am wondering how this could be...

I can't reproduce the problem on my server. An SSH connection on one VE is not shown on the ps -aux output of another VE.

Are you doing 'ps -aux' on the HN?

Please give more output (sanitized, but raw) if you want us to help more....

sorry, i dont have the output anymore. But i have checked it carefully. There was nothing but some normal damon-processes and some processes caused by qmail(tcp-env, qmail-send, qmail-smtp etc.). (i have done "ps aux" in my VE)
Can you assign different ips to a e-card and the ips to different VEs? Would that reproduce this

problem?
What do you mean with HN?
Thanks for your reply.
