

Hi

I am following the instructions on Openvz website for installing openvz on ubuntu 7.10 which is a Debian based system.
However, at the 'aptitude install ' step I get the error msg ' ovzkernel-2.6.9 not found'.

Any help is appreciated
Thanks
Amba

Add to your "/etc/apt/sources.list"

```
deb http://debian.systs.org/debian sarge openvz
```

and get the new package lists

```
# apt-get update
```

[edit<http://wiki.openvz.org/w/index.php?title=Installation_on_Debian&action=edit§ion=3>
] precompiled kernel images at debian.systs.org (dso)

The kernel-images on debian.systs.org (dso) use the same kernel-config taken from OpenVZ. (most kernel-modules are built-in!)

If there is more than one CPU available (or a CPU with hyperthreading), use the kernel-smp deb. If there is more than 4 Gb of RAM available, use the kernel-enterprise deb. Otherwise, use the plain kernel deb (kernel).

Kernel flavors list Kernel type Description Hardware Use case -
uniprocessor

up to 4GB of RAM -smp symmetric multiprocessor up to 4 GB of RAM 10-20 VPSs
-entnosplit SMP + PAE support up to 64 GB of RAM 10-30 VPSs -enterprise SMP
+ PAE support + 4/4GB split up to 64 GB of RAM >20-30 VPSs

kernel-image: i368 and amd64

```
ovzkernel-2.6.9  
ovzkernel-2.6.9-smp
```

kernel-image: i386 only:

```
ovzkernel-2.6.9-enterprise  
ovzkernel-2.6.9-entnosplit
```

OpenVZ tool(s) for i386 and amd64

vzctl
vzquota
vzprocps
vzdump

template(s) for i386 and amd64 : Debian 3.1 Minimal

vzctl-ostmpl-debian

[edit<http://wiki.openvz.org/w/index.php?title=Installation_on_Debian&action=edit§ion=4>
] installing the kernel-images, toolset and debian-os-template

Example: install the stable OpenVZ kernel, tools and Debian OS Template

```
# aptitude install ovzkernel-2.6.9 vzctl vzquota vzdump vzctl-ostmpl-debian
```

debian.systs.org doesn't have the 2.6.9 kernels anymore.
Try ovzkernel-2.6.18.

I guess that Ubuntu 7.10 corresponds to Debian Etch, so you are using the wrong part of the instruction.

You should look at

http://wiki.openvz.org/Installation_on_Debian#precompiled_kernel_images_at_debian.systs.org

And yes, the page is organized badly, I would suggest moving "building your own kernel in a debian way" to a separate article, and maybe even provide separate articles for Sarge and Etch. Can somebody work on it?

Kir

Thanks for your answer. I am now running into the following problem:

At the step:

```
#sudo wget http://debian.systs.org/dso_archiv_signing_key.asc -q -O - |  
apt-key add -
```

```
gpg: no writable keyring found: eof  
gpg: error reading '-': general error  
gpg: import from '-' failed: general error
```

Hi Amba,

for ubunutu, you should use:

```
# wget http://debian.systs.org/dso_archiv_signing_key.asc -q -O - |  
sudo apt-key add -
```

Bye,
Thorsten

Thanks Thorsten. Unfortunately, I am still running into the following problem

On reboot, i get the error msg 'Statrtng OpenVZ: failed to load module
vzmon..failed'

I also did a 'sudo apt-get install vzctl vzquota vzdump vzctl-ostmpl-debian'
but that did not fix above problem. Also, vzctl-ostmpl-debian could not be
found.

Thanks again for your assistance
Amba

Thorsten,

The Ubuntu version is 7.10 and the booted linux kernel is 2.6.22-14-server.

Thanks
Amba

Hi Amba,

ok, i've supposed that, the error occurred while a non-OpenVZ kernel is booted:

ubuntu shipped a kernel version 2.6.22-... and the (stable) OpenVZ Kernel at debian.systs.org is a 2.6.18, so the first kernel to boot is the 2.6.22 and then the "older" 2.6.18 OpenVZ kernel.

So please inspect your boot loader config, eg. grub (-> edit /boot/grub/menu.list) and place the openvz kernel on first boot order and reboot the machine.

and voila another OpenVZ node is on the way :-)

Bye,
Thorsten

Thanks Thorsten - that did fix the problem. :)

Thanks a lot!
Amba
