Hello,
i have a Problem with Openvz and Ubuntu 7.10. The Host System is a Ubuntu 7.10 with the
2.6.18-fza-028stab051.1-686 Kernel. In my Guest System (Ubuntu 7.10) i have only 2 Network
Devices and no Local Loopback but i neep this for my DNS Server.

When I Start a Debian guest i have this devices.

root@ubuntu-ns:/# ifconfig
venet0   Link encap:UNSPEC HWaddr 00-00-00-00-00-00-00-00-00-00-00-00-00-00-00-00
          inet addr:127.0.0.1 P-t-P:127.0.0.1 Bcast:0.0.0.0 Mask:255.255.255.255
          UP BROADCAST POINTOPOINT RUNNING NOARP MTU:1500 Metric:1
          RX packets:0 errors:0 dropped:0 overruns:0 frame:0
          TX packets:0 errors:0 dropped:0 overruns:0 carrier:0
          collisions:0 txqueuelen:0
          RX bytes:0 (0.0 b) TX bytes:0 (0.0 b)

venet0:0 Link encap:UNSPEC HWaddr 00-00-00-00-00-00-00-00-00-00-00-00-00-00-00-00
          inet addr:10.0.0.1 P-t-P:10.0.0.1 Bcast:0.0.0.0 Mask:255.255.255.255
          UP BROADCAST POINTOPOINT RUNNING NOARP MTU:1500 Metric:1

Why do you need loopback addresses? I run many DNS servers in VE and I don't have any
problems...

Ok for the DNS Server is the loop back device not necessary but, i have many PHP Scripts on the
server, and this scrips use the 127.0.0.1 for the Mysql Connection.

Try to do /etc/init.d/network restart, if that doesn't help do /etc/init.d/network stop and then remove /var/run/network/ifstate.

Have you tried using localhost instead of 127.0.0.1?

Hello,
Thanks Ths
/etc/init.d/network stop and then remove /var/run/network/ifstate.

Works now i have the local loopback and can ping 127.0.0.1 or localhost

I have a last question, is it not good to use Ubuntu & OpenVz? I can change without problems to Debian 4.0.

I have the same problem. Stopping services and restaring after deleting ifstate does work, but the next time the vps restarts the loopback interface is gone again.

How do you add it permanently?

Hi, seems like this is a problem specific to the ubuntu network interface configuration script. Its not really an openvz problem but rather a bug/problem with the ip/ifconfig calls being executed by the init script.

Is this an unmodified version of the ubuntu template in the openvz mirrors?

Rick

This is the template available for download on the OpenVZ site for Ubuntu 7.

Yep, its a template problem rather than a OS problem.

Instead of messing with /var/run/network/ifstate, I've found:

ifdown lo
ifup lo
works fine too.

Still, I'd like to find a permanent solution as well. I'm wondering if the line:

/etc/init.d/networking restart
in /etc/rc.local has something to do with it. I see that case excludes the 'lo' interface. What about just linking networking into the rcN.d directory, or using 'start' in rc.local instead of restart, if the networking script has not been run?

(I'm running on a remote VPS, so I'm a bit a limited in what messing around I can do with networking. If I break it, I can't get back in to change back! Otherwise, it'd try it myself.)

Well, it looks like that networking restart line is necessary on my hosting environment as well, so my work-around is to add the ifdown/ifup commands to /etc/rc.local, after the networking restart. This works for me, but of course, does not get us any closer to the root of the problem with the network interfaces failing to come up in the first place.

Here's my modified version of /etc/rc.local:

#!/bin/sh -e
#

```
# rc.local
#
# This script is executed at the end of each multiuser runlevel.
# Make sure that the script will "exit 0" on success or any other
# value on error.
#
# In order to enable or disable this script just change the execution
# bits.
#
# By default this script does nothing.

/etc/init.d/networking restart

/sbin/ifdown lo
/sbin/ifup lo

exit 0
```

Hope that helps someone!

A further tweak to the above:

Some init scripts (postfix in particular, in my case) expect the network interfaces to be available when they run, and rc.local is running too late (priority 99) in the init order.

So I've moved the contents of the rc.local script posted earlier into a new /etc/init.d/networking-restart script, and set its priority to S15/K85, so that it runs before most other init scripts. (It could probably go earlier; I just chose 15 because it was before ssh and postfix.) The following installs the new init script into the init start/stop queues:

update-rc.d networking-restart start 15 2 3 4 5 . stop 85 0 1 6 .

Again, this doesn't solve the issue, only provides a work-around, each step a little better than the previous. I don't know how to incorporate this into the official Ubuntu image, but I would be pleased to see it. And, of course, suggestions for further improvements are welcomed.
