I wonder if it is possible to detect the IP address of a virtual ethernet device inside VE0? Sure, I can do:

> vzctl exec 777 ifconfig eth0

but is there a faster way, maybe an ioctl for veth777.0

(VPS777 uses dhcp to get the ip address)

Hello Dietmar,

well, looks like "vzctl exec" is the only way to get the access to the veth settings inside a VE.

Well, slight speedup you can get if you use "ip" command instead of "ifconfig".

Hope using "vzctl exec" is not so slow, isn't it?
