Hello

I have installed kernel 2.6.18-ovz-028stab051.1 as the 1st kernel to boot in GRUB. It seemed to boot fine initially but today I find the following error when I boot:

```
Loading,please wait...  
/scripts/local-top/lvm2: 68: tr: not found  
/scripts/local-top/lvm2: 68: sed: not found  
/scripts/local-top/lvm2: 67: sed: not found  
No volume groups found  
ALERT! /dev/mapper/ubuntu-root does not exist. Dropping to a shell!  
Check your root= boot argument (cat /proc/cmdline)  
Check for missing modules (cat /proc/modules), or device files (ls /dev)  
(initramfs)
```

Any assistance on this is greatly appreciated

Amba

ps. rebooting into kernel 2.6.22-14-server works fine

Whatever your distribution of choice puts into the initrd init scripts, it does not work, which is probably in no way associated with OpenVZ. You might be more lucky seeking help on your distro's support forums/lists.

regards,

Make sure tr and sed are installed?

> No volume groups found

It looks like one of your distro's init scripts uses tr and sed to process the LVM configuration. Because they fail it must assume there are no volume groups. You must have uninstalled those utilities sometime between now and your last reboot and now the init script fails. Boot from a rescue CD and reinstall those utilities.

Regards,
Cliff

thanks for all of your responses. I just went ahead and reinstalled Ubuntu and everything is fine now.
