Hello,

I'm trying to install cPanel on 2 different VPSes, but it isn't going through as it should be. I tried the installation on dedi and it was completed without any glitches(yes, a dedi is easier to manage than a VPS)

I'm mainly getting this error:

```
[root@server home]# sh latest
```

```
Creating directory install
```

```
Verifying archive integrity...latest: fork: Cannot allocate memory
```

```
Error in checksums: is different from 3288460579
```

And the number 3288460579 is sometimes different, but everytime I can see only memory limit errors. How do I fix\ them, as these are on every vps?

You're simply hitting the memory barrier. Do you have control on the Hardware Node? If not, how much memory is allocated to your VPS?

Yes, I've control over node.

The allocated memory is 512 MB G. with 1024 Burst.

I think this is sufficient for cPanel as I've even run cPanel on 384 MB....

How do I fix it as it seems basically a configuring problem with all the VPSes.

what show

'cat /proc/user_beancounters' (failcnt)?
