---

I am trying to get a set of VMs to run SSH / Apache

I have VM 2010 at ip 10.0.20.10, it runs SSH & Apache on ports 22 and 80 respectively.

with the following:

```
iptables -t nat -A PREROUTING -p tcp -m tcp --dport 2010 -j DNAT --to 10.0.20.10:22
iptables -t nat -A PREROUTING -p tcp -m tcp --dport 2011 -j DNAT --to 10.0.20.10:80
```

I get this:

```
Chain PREROUTING (policy ACCEPT 72 packets, 9800 bytes)
pkts bytes target    prot opt in     out     source    destination
  1  52 DNAT      tcp  --  *      *       0.0.0.0/0  0.0.0.0/0      tcp dpt:2010
to:10.0.20.10:22
 24 1216 DNAT    tcp  --  *      *       0.0.0.0/0  0.0.0.0/0      tcp dpt:2011
to:10.0.20.10:80
```

Now, for some reason the connection doesn't go through with Apache, but works perfect with SSH.

Apache is running, but I can't even connect from the main node:

```
#telnet 10.0.20.10 80
Trying 10.0.20.10...
telnet: connect to address 10.0.20.10: Connection refused
telnet: Unable to connect to remote host: Connection refused
```

What should I look at?

Hi,

plz check if the mysqld listen only on 127.0.0.1 (=localhost!)

I am assuming you mean httpd (not mysqld)

I set httpd.conf to listen to the virtual server's IP.

From the main node, I can do telnet 10.0.20.10 80 and it works. But, from the outside, it doesn't.

However, when I check with iptables --list -n -v -t nat I can see the packets coming from the outside, but it still does not work.

Hi

can you plz check if a apache is running in VE and has no problem to start, any ubc failcounters reached (->cat /proc/user\_beancounters ) ?

weird! now it is running, same setup... after a reboot...

Apache was listening, I could telnet to it from the main node, but not from 'the outside world', until the reset
