I get VE: XXX: failed to start with err=-11 when try start VE, if i stop another VE its started.

Have OpenVZ limit to max running VE?

openVZ has not such limits, but system can lacks some resources.
could you please check failcounters in /proc/user_beancounters?

Do you probably have some messages in /var/log/vzctl.log ?
You can get more informatuion if You set LOG_LEVEL=10 in global configuration file (/etc/sysconfig/vz)? and repeat the experiment.

I had this issue as well after creating my own ve-vps.conf-sample with vzsplit, replacing ve-vps.basic.conf-sample. It turned out vz set all to low and wrong values for quota and inodes, so in some cases I couldn't even create a VE as just the template caused the quota hardlimit to trigger

I think you can test this simple by setting DISK_QUOTA=no, if it works then you have found your problem

/Joakim

I have now set DISK_QUOTA=no and test DISK_QUOTA=no

If DISK_QUOTA=on

```
vzctl : VE 205 : Starting VE ...
vzctl : VE 205 : Running: /usr/sbin/vzquota show 205
vzctl : VE 205 : Running: /usr/sbin/vzquota on 205 -r 0 -b 1048676 -B 1153534 -i 200100 -l
220100 -e 0 -n 0 -s 0

vzctl : VE 205 : Mounting root: /var/lib/vz/root/205 /var/lib/vz/private/205

vzctl : VE 205 : VE is mounted
vzctl : VE 205 : Set iptables mask 0x000017bf
vzctl : VE 205 : Set features mask 0000000000000000/0000000000000000
vzctl : VE 205 : VE start failed
vzctl : VE 205 : Running: /usr/sbin/vzquota stat 205 -f
vzctl : VE 205 : Running: vzquota setlimit 205 -b 1048576 -B 1153434 -i 200000 -l 220000 -e 0 -n
0

vzctl : VE 205 : Running: /usr/sbin/vzquota stat 205 -f
vzctl : VE 205 : Running: /usr/sbin/vzquota off 205
vzctl : VE 205 : VE is unmounted
```

If DISK_QUOTA=off

```
vzctl : VE 205 : Starting VE ...
vzctl : VE 205 : Mounting root: /var/lib/vz/root/205 /var/lib/vz/private/205

vzctl : VE 205 : VE is mounted
vzctl : VE 205 : Set iptables mask 0x000017bf
vzctl : VE 205 : Set features mask 0000000000000000/0000000000000000
vzctl : VE 205 : VE start failed
vzctl : VE 205 : Running: /usr/sbin/vzquota stat 205 -f
vzctl : VE 205 : VE is unmounted
```

Correcting myself as this has started again, same pattern but I get err=-17 and now nothing seem to help, even if I switch off disk quota and give plenty of resourses... still can run max 1 VE

/Joakim

is it possible to get an access to check?
-17 means EEXISTS, so something wrong since kernel thinks that some object already exists.
Maybe something messed with IDs (VEID, etc.)

What -11 means?

#define EAGAIN 11 /* Try again */

almost similar in your context.

AFAICS from our your posts you use 2.6.22, correct?
and have oopses/call traces. may worth filling in bug.

You mean ssh access? sure, need to make some arrangements then though as I have the firewall
configured to only let through sshd connects from my static IP. If you have a static ip or at least
range that would make it easier. we can arrange that through privatemessage I guess.

Also look in my main thread about this (<http://forum.openvz.org/index.php?t=msg&th=5125&star=0&>) as I don't want to hijack this one

/Joakim

I have 2.6.22 yes, don't know about patrickweb. I have tried to use 2.6.18 but cannot boot as it
refuses to see my sata disk as sda, whatever config I try, just hda and 33Mhz bus speed which
mean I have to change my fstab to mount hda and if fail mean I cannot boot into other kernel I
have for backup - so no choice really.

As 2.6.22 is frozen I don't know if it's any use to file a bug on it - I would rather like to go for testing
2.6.24 then.

I use 2.6.18-openvz-686.

Hi Patrik,

do you have some error messages in the host system logs?

thank you,
Vasily Averin
