
Subject: Kernel issue?

My home server is having these issues:

It is running centos 5 and 2.6.18-53.el5.028stab051.1 kernel

kernel: ide: failed opcode was: unknown

kernel: hdc: no DRQ after issuing MULTWRITE_EXT

kernel: ide1: reset: success

I read it could be due to a dying hdd so I replaced it but the issue is still appearing although less often.

Any help would be appreciated

IMHO it could be caused by bad cable connections.
