
Subject: [patch 00/10] mount ownership and unprivileged mount syscall (v7)

Posted by [Miklos Szeredi](#) on Wed, 16 Jan 2008 12:31:47 GMT

[View Forum Message](#) <> [Reply to Message](#)

Thanks to everyone for the comments on the previous submission.

Christoph, could you please look through the patches if they are acceptable from the VFS point of view?

Thanks,
Miklos

v6 -> v7:

- add '/proc/sys/fs/types/<type>/usermount_safe' tunable (new patch)
- do not make FUSE safe by default, describe possible problems associated with unprivileged FUSE mounts in patch header
- return EMFILE instead of EPERM, if maximum user mount count is exceeded
- rename option 'nomnt' -> 'nosubmnt'
- clean up error propagation in dup_mnt_ns
- update util-linux-ng patch

v5 -> v6:

- update to latest -mm
- preliminary util-linux-ng support (will post right after this series)

v4 -> v5:

- fold back Andrew's changes
- fold back my update patch:
 - o use fsuid instead of ruid
 - o allow forced unpriv. unmounts for "safe" filesystems
 - o allow mounting over special files, but not over symlinks
 - o set nosuid and nodev based on lack of specific capability
- patch header updates
- new patch: on propagation inherit owner from parent
- new patch: add "no submounts" mount flag

v3 -> v4:

- simplify interface as much as possible, now only a single option ("user=UID") is used to control everything
- no longer allow/deny mounting based on file/directory permissions, that approach does not always make sense

v1 -> v3:

- add mount flags to set/clear mnt_flags individually
- add "usermnt" mount flag. If it is set, then allow unprivileged submounts under this mount
- make max number of user mounts default to 1024, since now the usermnt flag will prevent user mounts by default

Subject: [patch 01/10] unprivileged mounts: add user mounts to the kernel
Posted by [Miklos Szeredi](#) on Wed, 16 Jan 2008 12:31:48 GMT
[View Forum Message](#) <> [Reply to Message](#)

From: Miklos Szeredi <mszeredi@suse.cz>

This patchset adds support for keeping mount ownership information in the kernel, and allow unprivileged mount(2) and umount(2) in certain cases.

The mount owner has the following privileges:

- unmount the owned mount
- create a submount under the owned mount

The sysadmin can set the owner explicitly on mount and remount. When an unprivileged user creates a mount, then the owner is automatically set to the user.

The following use cases are envisioned:

- 1) Private namespace, with selected mounts owned by user. E.g. /home/\$USER is a good candidate for allowing unpriv mounts and unmounts within.
- 2) Private namespace, with all mounts owned by user and having the "nosuid" flag. User can mount and umount anywhere within the namespace, but suid programs will not work.
- 3) Global namespace, with a designated directory, which is a mount owned by the user. E.g. /mnt/users/\$USER is set up so that it is bind mounted onto itself, and set to be owned by \$USER. The user can add/remove mounts only under this directory.

The following extra security measures are taken for unprivileged mounts:

- usermounts are limited by a sysctl tunable
- force "nosuid,nodev" mount options on the created mount

For testing unprivileged mounts (and for other purposes) simple mount/umount utilities are available from:

<http://www.kernel.org/pub/linux/kernel/people/mszeredi/mmount/>

After this series I'll be posting a preliminary patch for util-linux-ng, to add the same functionality to mount(8) and umount(8).

This patch:

A new mount flag, MS_SETUSER is used to make a mount owned by a user. If this flag is specified, then the owner will be set to the current fsuid and the mount will be marked with the MNT_USER flag. On remount don't preserve previous owner, and treat MS_SETUSER as for a new mount. The MS_SETUSER flag is ignored on mount move.

The MNT_USER flag is not copied on any kind of mount cloning: namespace creation, binding or propagation. For bind mounts the cloned mount(s) are set to MNT_USER depending on the MS_SETUSER mount flag. In all the other cases MNT_USER is always cleared.

For MNT_USER mounts a "user=UID" option is added to /proc/PID/mounts. This is compatible with how mount ownership is stored in /etc/mtab.

The rationale for using MS_SETUSER and MNT_USER, to distinguish "user" mounts from "non-user" or "legacy" mounts are follows:

- Mount(2) and umount(2) on legacy mounts always need CAP_SYS_ADMIN capability. As opposed to user mounts, which will only require, that the mount owner matches the current fsuid. So a process with fsuid=0 should not be able to mount/umount legacy mounts without the CAP_SYS_ADMIN capability.
- Legacy userspace programs may set fsuid to nonzero before calling mount(2). In such an unlikely case, this patchset would cause an unintended side effect of making the mount owned by the fsuid.
- For legacy mounts, no "user=UID" option should be shown in /proc/mounts for backwards compatibility.

Subject: [patch 03/10] unprivileged mounts: propagate error values from clone_mnt
Posted by [Miklos Szeredi](#) on Wed, 16 Jan 2008 12:31:50 GMT
[View Forum Message](#) <> [Reply to Message](#)

From: Miklos Szeredi <mszeredi@suse.cz>

Allow clone_mnt() to return errors other than ENOMEM. This will be used for returning a different error value when the number of user mounts goes over the limit.

Fix copy_tree() to return EPERM for unbindable mounts.

Signed-off-by: Miklos Szeredi <mszeredi@suse.cz>

Subject: [patch 04/10] unprivileged mounts: account user mounts
Posted by [Miklos Szeredi](#) on Wed, 16 Jan 2008 12:31:51 GMT
[View Forum Message](#) <> [Reply to Message](#)

From: Miklos Szeredi <mszeredi@suse.cz>

Add sysctl variables for accounting and limiting the number of user mounts.

The maximum number of user mounts is set to 1024 by default. This won't in itself enable user mounts, setting a mount to be owned by a user is first needed.

[akpm]
- don't use enumerated sysctls

Subject: [patch 05/10] unprivileged mounts: allow unprivileged bind mounts

Posted by [Miklos Szeredi](#) on Wed, 16 Jan 2008 12:31:52 GMT

From: Miklos Szeredi <mszeredi@suse.cz>

Allow bind mounts to unprivileged users if the following conditions are met:

- mountpoint is not a symlink
- parent mount is owned by the user
- the number of user mounts is below the maximum

Unprivileged mounts imply MS_SETUSER, and will also have the "nosuid" and "nodev" mount flags set.

In particular, if mounting process doesn't have CAP_SETUID capability, then the "nosuid" flag will be added, and if it doesn't have CAP_MKNOD capability, then the "nodev" flag will be added.

Signed-off-by: Miklos Szeredi <mszeredi@suse.cz>

Acked-by: Serge Hallyn <serue@us.ibm.com>

Subject: [patch 09/10] unprivileged mounts: propagation: inherit owner from parent
Posted by [Miklos Szeredi](#) on Wed, 16 Jan 2008 12:31:56 GMT

[View Forum Message](#) <> [Reply to Message](#)

From: Miklos Szeredi <mszeredi@suse.cz>

On mount propagation, let the owner of the clone be inherited from the parent into which it has been propagated.

If the parent has the "nosuid" flag, set this flag for the child as well. This is needed for the suid-less namespace (use case #2 in the first patch header), where all mounts are owned by the user and have the nosuid flag set. In this case the propagated mount needs to have nosuid, otherwise a suid executable may be misused by the user.

Similar treatment is not needed for "nodev", because devices can't be abused this way: the user is not able to gain privileges to devices by rearranging the mount namespace.

Subject: [patch 10/10] unprivileged mounts: add "no submounts" flag

Posted by [Miklos Szeredi](#) on Wed, 16 Jan 2008 12:31:57 GMT

[View Forum Message](#) <> [Reply to Message](#)

From: Miklos Szeredi <mszeredi@suse.cz>

Add a new mount flag "nosubmnt", which denies submounts for the owner.

This would be useful, if we want to support traditional /etc/fstab

based user mounts.

In this case mount(8) would still have to be suid-root, to check the mountpoint against the user/users flag in /etc/fstab, but /etc/mtab would no longer be mandatory for storing the actual owner of the mount.

Signed-off-by: Miklos Szeredi <mszeredi@suse.cz>

As discussed many months ago this does seem like the most appropriate
behavior for propagation.
