Do you mean that these are happening with 2.6.23-mm1, even without any
lxc patches?

Have you reported these to LKML or to Andrew Morton? If not, please do.
You can make sure to garner attention by putting something like,

2.6.23-mm1 fcntl regressions

as the subject. But, please do make sure they're regressions, and
pinpoint the versions where they occur. You should also be prepared to
do a bisection of the patches in -mm to find it.

I think Rishi is referring to these failures when running LTP in
a child pid namespace. That is a known problem. Its not a regression
but a pending task in pid namespace cleanup.
