Hi,

I've got a problem with vzdump - it doesn't work. Please look at this.

```
root@vps:~# vzdump --compress --dumpdir /vz/dump --snapshot 1
ERROR: strange VPS ID '1'
```

usage: /usr/bin/vzdump OPTIONS [--all | VPSID]

```
--exclude VPSID      exclude VPSID (assumes --all)
--exclude-path REGEX  exclude certain files/directories
--compress           compress dump file (gzip)
--dumpdir DIR        store resulting files in DIR
--xdelta             create differential backup using xdelta
--mailto EMAIL       send notification mail to EMAIL.
--stop              stop/start VPS if running
--suspend           suspend/resume VPS when running
--snapshot          use LVM snapshot when running
--restore FILENAME   restore FILENAME
```

VEID 1 was created correctly several days ago and now is online.

Server is based on Ubuntu Gutsy Gibbon GNU/Linux: Linux v02 2.6.18-fza-028stab051.1-amd64
#1 SMP Fri Dec 7 15:14:08 UTC 2007 x86_64 GNU/Linux.

Does anyone know how to backup VPS correctly without this error?

Thanks.

Yours sincerely, Martin Carboll

Hi Martin,

the first VEID should be 101, not be 1 (explained at OpenVZ User Guide, page 22) so change your VEID to 101 and start vzdump.

Hi Thorsten,

thanks for your advice, it is working now.

Martin Carb
