Does anyone else experience something like that:
when I stop the VE, and then start it, it's beancounters don't reset,
but, when I stop one VE, and then another one VE, first VE's beancounters
do get cleaned.

Yes, I have the same issue. Wait for a minute or two after you've
stopped the VE. It takes a few minutes for the kernel to clear it out.
Not quite sure why.

For you, it probably has nothing to do with that second VE, only the
fact that you've waited for a little while.

it takes time since TIME WAIT buckets and similar objects should live during some period
according to appropriate RFCs.
