Hi all,

i want to run a few qemu VMs inside VE0. Just wonder how to set fairsched properties for a single process?

- howto create a new faisched group (for the gemu process)?
- howto assign weight/rate

or is that not possible at all?

- Dietmar

OK, basically found the syscall interface in kernel/fairsched.c

But how do I find out the syscall numbers, i.e how do I call sys\_fairsched\_mknod() with userspace syscall()

- Dietmar

check vzctl sources. it calls other OVZ-specific syscalls by their numbers, like sys\_setluid, sys\_setublimit etc.

For creating fairsched node you'll need to call fairsched\_mknod first, then move the process to this node using fairsched\_mvpr

```

OK, I wrote a small (perl) script to test those syscalls, and everything work as expected, for example:

```
fairsched_mknod (0, 500, 400);
fairsched_vcpus (400, 1);
set_cpulimit (400, 25);
fairsched_mvpr ($$, 400);
fork_and_do_something(); # runs with 25% cpu wait
fairsched_rmnod (400);
...
```

work perfectly.

But when I call fairsched\_rmnod(400) from another process while there is still a process running inside 400 the system freezes. I get a kernel panic somewhere inside move\_task\_off\_dead\_cpu.

any idea how to fix that?

- Dietmar

node should be deleted normally only when no processes left. it's possible to fix syscall to return an error when node is non-empty...

Ok, will try make sure that no processes left. But I thing the syscall should be fixed too.

care to create a patch?

Please can you give me a hint where i can find the list of processes associated with a fairsched node?

- Dietmar

AFAIR the only way is to take tasklist\_lock and check for tasks having vsched == your-node-vsched.
