
Subject: problem building fedora core 5 cache

Hi,

I didn't download the Fedora Core 5 snapshot, preferring to build the OS template cache from scratch. The only problem is that I get the following error:

```
Transaction Check Error: file /etc/named.conf conflicts between
attempted installs of caching-nameserver-7.3-5.FC5 and bind-9.3.2-20.FC5
ERROR: yum failed with 1 exit code
```

which obviously causes the template creation to fail.

The same process worked fine for Centos-4.

I guess I have two options:

- 1) try and fix the problem
- 2) use the snapshot for FC5

Does anyone know if (1) is possible and if so how to do it?

Colin

Colin,

They did something weird in FC5 :(

What you should do to fix it is edit the file named
/vz/template/fedora-core/5/i386/config/default.list and change
"caching-nameserver" to "bind-config" in it.

We will provide the updated packages for fc5 metadata soon (early next week).

Regards,
Kir.
