
Subject: calculation of resource values (numfiles)

Hello

i would like to know how the resource value "numfile" which is accessible by /proc/user_beancounters inside the VE is calculated. I was under the impression that a "lsof | wc -l" inside the VE should match this value but "numfile" is higher by more than 50%.

lsof | wc -l --> 1050

cat /proc/user_beancounters --> numfile = 1673

Is this caused by some kernel resources not available by "lsof" from inside the VE??

Many Thanxs

Andreas
