Hi,

New to OpenVZ, managed to get it so that I provisioned two VPS - 101 and 102, using Centos 5 for the HN, and centos 5 for the VPS, as below:

```
[root@lab03 cache]# vzpkgls 101
centos-5-i386-default
```

However, I cannot seem to get the cached version of Centos 5 to appear when I run "vzpkgls" and "vzpkgls --cached" as below:

```
[root@lab03 cache]# vzpkgls
centos-4-i386-minimal
centos-4-i386-default
```

```
[root@lab03 cache]# vzpkgls --cached
centos-4-i386-minimal
centos-4-i386-default
```

I believe I have everything in the right place:

```
[root@lab03 cache]# pwd ; ls
/vz/template/cache
centos-4-i386-default.tar.gz centos-5-i386-default.tar.gz
centos-4-i386-minimal.tar.gz
```

Can anyone guide me into how to get centos5 appearing properly, so I can get yum working for my VPSes.

Thanks in advance

Robert McNaught

Hi,

To get yum working for your VPSes you can apply several ways:

1. Install yum inside your VPS like on the common Centos-5 system, i.e. enter to your VPS and install appropriate packages.

2. Install yum inside your VPS from HN using vzyum utility.

`vzyum <VPS_ID> install yum`

To apply this way you have to install appropriate template metadata package on HN which is usually named as `vztpls-os_name.arch.rpm`. I couldn't have found appropriate package on the <http://download.openvz.org/> but please look at this page

<http://forum.openvz.org/index.php?t=msg&th=2512&star t=40&>

Steve created `vztmpl-centos-5-2.0-3.i386.rpm`. I think you can get it.
