
Subject: Kernel Headers for older kernel

I am using a VPS system that is older and the kernel hasn't been updated recently. I need to build asterisk and zaptel, both of which require the kernel headers or the full kernel source.

on the downloads.openvz.org site the following kernel is not listed:

2.6.9-023stab033.6-enterprise

I could instead use patch-023stab033-combined.gz to patch the vanilla kernel to 023stab033 which would give me the header info I need to compile the programs.

is there a svn server or other archive of all kernels used in the past?

I have no access to the host server, just the vps instance I was given.

If anyone has any help I would be greatly appreciative.

Thanks,

Clifford Wagner
