---

hi all,

my init logging patch works so far, but unfortunately it breaks  
checkpointing:

```
-----  
>vzctl chkpnt 101  
Setting up checkpoint...  
    suspend...  
    dump...  
Can not dump container: Invalid argument  
Error: d_path err=-22  
Checkpointing failed  
-----
```

Maybe some of the developers can give me a hint whats wrong?

lsof shows (16531 id the logging process)

```
lt-vzctl 16531      root cwd      DIR        0,22   4096  
1226401 /var/lib/vz/root/101  
lt-vzctl 16531      root rtd      DIR        0,22   4096  
1226401 /var/lib/vz/root/101  
lt-vzctl 16531      root txt      REG        8,1    98155  
2047179 /home/dietmar/pve/vzctl/vzctl-3.0.22/src/.libs/lt-vzctl  
lt-vzctl 16531      root mem      REG        0,0  
0 [heap] (stat: No such file or directory)  
lt-vzctl 16531      root mem      REG        8,1    97928  
1896840 /lib/ld-2.3.6.so  
lt-vzctl 16531      root mem      REG        8,1    488939  
2031943  
/home/dietmar/pve/vzctl/vzctl-3.0.22/src/lib/.libs/libvzctl-0.0.2.so  
lt-vzctl 16531      root mem      REG        8,1    10392  
1896846 /lib/libdl-2.3.6.so  
lt-vzctl 16531      root mem      REG        8,1    10520  
1896843 /lib/libutil-2.3.6.so  
lt-vzctl 16531      root mem      REG        8,1   1282008  
1896845 /lib/libc-2.3.6.so  
lt-vzctl 16531      root 0u      CHR        1,3  
1423308 /var/lib/vz/root/101/dev/null  
lt-vzctl 16531      root 1w      REG        0,22   1941  
1232142 /var/lib/vz/root/101/var/log/init.log  
lt-vzctl 16531      root 2r      FIFO       0,22  
1232141 /var/lib/vz/root/101/var/log/init fifo
```

Just a guess: its the logging proxess itself, because that process still runs on the host - I need to do a exec instead?

Ok, exec solves the problem. Attached is the new patch.

This looks good. Can you

- (1) make it optional, i.e. retain the old behavior by default and provide a way to turn init logging on (command-line switch, or VE config parameter)
- (2) make init-logger so it would not depend on perl being available inside the container; i guess it can be rewritten in shell as /bin/sh should be there
- (3) add the comment to init-logger saying that this file was copied from the host system to this container and so any changes made to it inside a container will be lost during the next container start
- (4) document it all

(5) add init-logger to the vzctl.spec file

Ok

Will try. But cant we depend on perl? Perl should be available on most platforms. I can even add a test if perl is available, and do not start the logger if there is no perl?

Ok, will send a new patch when ready.

Adding a check makes sense. But first -- why do you need perl at all? Is  
there something that can't be done in shell?

I guess you are right - will rewrite it.

I just remembered why I hate shell programming ;-)

Please can someone tell me how to do a binary read with a shell. In perl  
I simple do:

```
while (my $len = sysread (LOGFIFO, $buf, 4096)) {  
    syswrite (LOGFILE, $buf);  
}
```

How to do that with a shell script? I first tried:

```
cat <$logfifo >>$logfile
```

But that spans a new process, and I do not want that.

Using builtin commands only:

```
while [ 1 ]; do  
    read line || break  
    echo $line  
done < $logfifo >>$logfile
```

Works, but always waits for whole lines (we want to read/write  
immediately instead)

The following code works for bash, but not for other shells:

```
while [ 1 ]; do  
    # -n is not available everywhwere (i.e. dash)  
    read -n 1 data || break  
    if [ -z $data ]; then  
        echo  
    else  
        echo -n $data  
    fi  
done < $logfifo >>$logfile
```

Any Ideas?
