Hi,
I am using 2.6.18-fza-028stab051.1-686-bigmem kernel on a Debian 4.0 host.
I can not start more than 49 VEs, I have read many documents which talk about running hundreds of VEs using OpenVZ. I am wondering why I can't get there.
I appreciate your help.

it is certainly possible. If you are looking for a specific answer, start by posting the error message or condition you see.

Thanks!
My machine has 8GB memory.
I have 49 VE running (101-149), when I start VE 150, I got the followings:
The dmesg gives:
VE: 150: failed to start with err=-11
UBC: preparing to turn dcache accounting on, size 20300 pages, watermarks 0 20300
UBC: turning dcache accounting on succeeded, usage 3943688, time 0.016

The vzctl.log gives:
vzctl : VE 150 : Starting VE ...
vzctl : VE 150 : Mounting root: /vz/root/150 /vz/private/150
vzctl : VE 150 : Running: /etc/vz/conf/vps.mount
vzctl : VE 150 : VE is mounted
vzctl : VE 150 : Set iptables mask 0x000017bf
vzctl : VE 150 : Set features mask 0000000000000000/0000000000000000
vzctl : VE 150 : VE start failed
vzctl : VE 150 : Running: /usr/sbin/vzquota stat 150 -f
vzctl : VE 150 : VE is unmounted

And there are no fails in the /proc/user_beancounters.

I have tried to set the parameters in the "ulimit" as large as I can. But it did not solve the problem.

Well, if you are intending to run a lot of containers for the purpose of checking how many container you can run on your machine. I guess use vzsplitt to split the resources equally on all of them. As for my case I managed to run 55 container on a 2 GB RAM.

You might experience some memory shortage due to limitation of x86 arch.

To solve that, we recommend running x86_64 kernel on a boxes with more than 4GB of RAM. You can still run x86 VEs fine.

Thank you!

I am using Xeon CPU E5335 which applies EM64T.

Yes, I will try x86_64 kernel.

Because I am using a Debian box so I have to recompile the kernel with OpenVZ config (specifically kernel-2.6.18-x86_64-smp.config.ovz), right?

Thanks again!

to take full advantage of 64bit architecture, I'd advise to install 64bit distro instead of 32bit one

you don't really need to compile kernel from scratch unless you have some specific needs. just add the following to your /etc/apt/sources.list:

```
deb http://download.openvz.org/debian-systs etch openvz
deb-src http://download.openvz.org/debian-systs etch openvz
```

and, import the key

```
wget -q -O - http://download.openvz.org/debian-systs/dso_archiv_signing_key.asc | apt-key add -
```

and do:

```
apt-get update && apt-get install ovzkernel-2.6.18-smp
```

(assuming you use multiprocessor or multicore server)

Good point.
Now I can run more than 49 VEs, thanks.

But I only find 3GB memory with this kernel (ovzkernel-2.6.18-smp),
while my HN has 8GB memory.

How can I fix this?

You can fix it by installing 64bit Debian, it should not have any problem accessing memory over 3Gb. You get it here:
<http://www.debian.org/distrib/netinst>
For your 64 bit Xeon machine you need to pick 'amd64' distro.

Thank you all.
Now I am using kernel ovzkernel-2.6.18-enterprise, everything is fine. I started 500 VEs.

the ovzkernel are no more in the repository.

are there any other workarounds to get more the 49 VEs to run under debian etch?

You could use the "enterprise" config file to compile a new kernel.

[http://wiki.openvz.org/Different_kernel_flavors_\(UP,_SMP,_ENTERPRISE,_ENTNOSPLIT\)](http://wiki.openvz.org/Different_kernel_flavors_(UP,_SMP,_ENTERPRISE,_ENTNOSPLIT))

<http://packages.debian.org/de/etch/kernel-patch-openvz>

why don't use the openvz kernel from the debian repository?
