Subject: Help configuring virtual servers

Hello,

So, I've been playing around with OpenVZ and it's been great (dream come true, in fact), so now I'd like to deploy it in a production environment. My goal is to create 10 server configs on a 4GB RAM system, which is pretty trivial to do with the vzsplit command, but I'd like 9 of the servers to be pretty lightweight (httpd systems) and one system to be a heavyweight (email services). What is the best way to create the two configs in this case?

Regards,

khsys
