Subject: [RFC][PATCH 0/9] cgroups: block: cfq: I/O bandwidth controlling subsystem for CGroups based on CFQ
Posted by Vasily Tarasov on Fri, 15 Feb 2008 06:53:34 GMT
View Forum Message <> Reply to Message

From: Vasily Tarasov <vtaras@openvz.org>

The following patchset introduces I/O bandwidth controlling subsystem
for the CGroups framework based on the CFQ scheduler.
User can assign a priority from 0 to 7 to a cgroup, and I/O bandwidth
will be adjusted proportionally.
This effect is achieved by introducing a certain modifications to CFQ.
Now there is not only per process time slice, but also per cgroup
time slice. During cgroup's time slice only processes from current
cgroup can add requests to the queue. Inside cgroups's time slice
processes are managed based on (per-process) time slices (as usual in CFQ).
This is why we call this approach "two level CFQ".

Such kind of system works in OpenVZ project.

Patch is against 2.6.25-rc2-mm1

Comments, suggestions, criticism are all welcome.

From: Vasily Tarasov <vtaras@openvz.org>

Simply moves CFQ data structure definitions to the header file.

Subject: [RFC][PATCH 3/9] cgroups: block: cfq: I/O bandwidth controlling subsystem for CGroups based on CFQ

From: Vasily Tarasov <vtaras@openvz.org>

Extends the original CFQ data sructures and adds the major cfqio_subsys
data structure: cfqio_cgroup_data. Adds several helper functions,
which will be called later from CFQ code to form proper data
structures interconnection.

Signed-off-by: Vasily Tarasov <vtaras@openvz.org>

Switches the CFQ scheduler to use per-cgroup queue tree,
instead one queue tree per device.

Signed-off-by: Vasily Tarasov <vtaras@openvz.org>

Subject: [RFC][PATCH 6/9] cgroups: block: cfq: I/O bandwidth controlling subsystem for CGroups based on CFQ
Posted by Vasily Tarasov on Fri, 15 Feb 2008 06:59:51 GMT
View Forum Message <> Reply to Message

From: Vasily Tarasov <vtaras@openvz.org>

Introduces cgroups scheduling. Each time when I/O request is placed on
per-process request queue and there were no other requests from this
cgroup, this cgroup is added to the end of active cgroups list.

This list is service in round-robin fashion. Switching between
cgroups happens eiher when cgroup expires its time slice, either if there
are no more requests from it. Each time I/O request is completed,
we check if it was the last request from cgroup, and in this case remove
cgroup from the active list.

From: Vasily Tarasov <vtaras@openvz.org>

Takes into account requests that are in driver now. Before that we switched
cgroup if there were no requests to service in this cgroup. Now we also

check that there are no requests from this cgroups currently processed by
driver and only in this case allow switching.

Signed-off-by: Vasily Tarasov <vtaras@openvz.org>

A couple of details:
 1) Your clock is way off. These patches have a date stamp of Feb 15,
    but were actually sent out March 21 (and I'm behind in my reading of
    lkml - sorry ;).
 2) Please put a different Subject on each path ... not just the N/M
    patch number, but use different words to describe each patch.
