Hi,

I have a two quad-core 1.6 cpu and 8GB of ram.

I want to give one vps a 99% usage of cpu ant 99% of ram. How?

I tried to commant cpuunits in .conf file, but max what i get is:

```
localhost ~ # vzcpucheck
```

```
Current CPU utilization: 127000
```

```
Power of the node: 638430
```

Have you read the openvz pdf manual? If so, what specific questions do you have about the memory UBC metrics or cpuunits? Also check out the vzsplitt utility.

Rick
