I have installed the system, I have edited the sysctl.conf file. I have ipv4 forwarding enabled. I will try to be brief here.

My host network is 192.168.0.0

I have 192.168.0.54 assigned to eth0
virbr0 has an ip address of 192.168.122.1

I never installed or even know what virbr0 is.

I can ping 192.168.0.54 just fine.
I can ping 192.168.122.1 just fine.

I cannot ping my gateway at 192.168.0.1

I have no external network connectivity.

Before I installed openvz on this system, I could get out just fine.

here is my sysctl.conf file:

```
net.ipv4.ip_forward = 1
net.ipv4.conf.default.proxy_arp = 0
net.ipv4.conf.all.rp_filter = 1
net.ipv4.conf.default.accept_source_route = 0
net.ipv4.tcp_syncookies = 1
net.ipv4.conf.default.send_redirects = 1
net.ipv4.conf.all.send_redirects = 0
```

after reboot `cat /proc/sys/net/ipv4/ip_forward` returns a 1.

I'm not a brain surgeon. What am I missing? A default route somewhere? Everything on the host side looks fine. Why would I all of a sudden lose my ability to see my local network after installing openvz? Does the virbr0 interface take over all routing?

Any help is much appreciated.

Please,

what kernel do you use?

"uname -a"

Are you sure that it is OpenVZ kernel?

Please describe how did you install OpenVZ. Where have you got your kernel?
