This patch effectively reverts commit d0498d9ae1a5cebac363e38907266d5cd2eedf89  
aka "[NET]: Do not allocate unneeded memory for dev->priv alignment."

It was found to be buggy because of final unconditional += NETDEV\_ALIGN\_CONST  
removal.

For example, for sizeof(struct net\_device) being 2048 bytes, "alloc\_size"  
was also 2048 bytes, but allocator with debugging options turned on started  
giving out !32-byte aligned memory resulting in redzones overwrites.

Patch does small optimization in ->priv'less case: bumping size to next  
32-byte boundary was always done to ensure ->priv will also be aligned.  
But, no ->priv, no need to do that.
