
Subject: 2.6.24.4+debian+openvz doesn't work with nvidia-glx

Hi, folks.

I'm trying to switch my vserver installation to openvz, but meet some problems:

I get openz's git, prepare a patch from it, then get debian kernel (2.6.24.4 + debian patches) and compile all this together.

It looks like it works (I didn't test it well, but at least kernel has some api vzctl uses.), but nvidia closed source drivers don't.

It's kernel part compiles well, module loads, but Xserver can't get connection to kernel part, and says something like "could not initialize device". Nvidia driver version 169.12-1 from Debian Sid.

Can anybody comment this? Is there any success stories with openvz+nvidia-glx?
