Hi,

I want to run a box with the 3ware 9690SA SAS RAID controller. However, the kernel Virtuozzo uses doesn't officially support this device.

3ware themselves do make available a driver for the kernel, which can be compiled in manually. For this I'll need the kernel source Virtuozzo uses.

The latest kernel Virtuozzo uses for CentOS 5.1 is: 2.6.18-028stab053.10

Am I right in thinking this is the same one provided by OpenVZ:  
<http://wiki.openvz.org/Download/kernel/rhel5/028stab053.10> ?

Could I download the source, compile in the 3ware driver for the controller without all hell breaking loose and Virtuozzo dying?

Hi,

well, your idea looks correct - OpenVZ and Virtuozzo kernels are almost the same and your trick might bring you to a working system, but...  
why don't you try to ask Virtuozzo support? You have a problem, great. Just try to ask - may be they already have a solution?

I have asked Parallels, but they are awfully slow, even their sales staff work at a glacial pace and we need to order the correct parts for this new server this week.

Hell, I'll be surprised if Parallels even bother sending us the correct license this time without having to rant and scream.

OpenVZ is supported by Parallels, it makes sense to me to get a broad scatter of views.

To add an update on this - I've been able to install the driver with the kernel CentOS 5.1 uses, 2.6.18-53.1.14.el5.

But when I try the same method with the kernel Virtuozzo installs (2.6.18-028stab053.4) I receive the following error at boot:

```
3w_9xxx: disagrees about version of symbol struct_module
insmod: error inserting '/lib/3w-9xxx.ko': -1 Invalid module format
```

Then after a few more seconds and loading of other modules, it kernel panics, presumably because it cannot mount the file system.

The error, I believe, is because the kernel module was originally designed for an EL5 kernel and has been compiled on this basis. The Virtuozzo kernel differs slightly to the EL5 kernel and so is producing this error.

I have the src of the 3ware driver, but I'm stuck on what to do next. I've submitted a support ticket to 3ware / AMCC (makers of the card) who may be able to assist.

Bingo.

With assistance from 3ware:

```
# rpm -ivh ovzkernel-2.6.18-53.1.4.el5.028stab053.4.x86_64.rpm
# rpm -ivh ovzkernel-devel-2.6.18-53.1.4.el5.028stab053.4.x86_64.rpm
```

(downloadable here: <http://wiki.openvz.org/Download/kernel/rhel5/028stab053.4>)

```
# cd /usr/src ; ln -s /usr/src/kernels/2.6.18-53.1.4.el5.028stab053.4.x86_64 linux
```

Install GCC:

```
# yum install gcc
```

Download 3ware source (available on the full ISO, use  
packages/drivers/linux/src/2.6/kernels/new\_distributions/3w- 9xxx.tgz

```
# tar zxvf 3w* ; cd driver
# make -f Makefile
```

Update the ramdisk

```
# cp 3w-9xxx.ko /lib/module/2.6.18-028stab053.4/kernel/drivers/scsi
```

```
# mkinitrd -v -f /boot/initrd-2.6.18-028stab053.4.img 2.6.18-028stab053.4
```

Modify grub.conf and remove the OpenVZ kernel, as a Virtuozzo user I don't want this kernel booting, I want the Virtuozzo kernel:

```
# nano -w /boot/grub/grub.conf
```

Reboot.

I made a slight mistake with the ramdisk step:

```
# cp 3w-9xxx.ko /lib/modules/2.6.18-028stab053.4/kernel/drivers/scsi
```

Should be "modules" and not what I said above, "module".

Also, you'll need to repeat the process when updating Virtuozzo to 2.6.18-028stab053.10. When compiled against 2.6.18-028stab053.4 the 3ware driver doesn't work with 2.6.18-028stab053.10 unless recompiled.
