I mistakenly ran ELS script (<http://servermonkeys.com/els.php>) inside the NODE root instead of inside the vps container I was intending to run the script in, and everything basically stopped working - even after a hard reboot.

No vps's load, no sites work. The vzagent is not pinging. Cannot connect via VZMC as a result.

The following error(s) were detected:

Code

Description

1

Most likely your service Virtual Private Server is down or you have entered invalid host address.

I stopped the ELS script at the mytop install yes/no step. I selected yes for all previous install options EXCLUDING apf and bfd. I did a yes on sysctl.conf hardening, disable register globals, chmod dangerous file folder (which probably caused the problem).

Please help me revert this back to normal.

Unfortunately, this forum is openvz centric and it seems that you are running virtuoizzo. You'd be best served by contacting Parallels technical support.
