Hi Forum, i tried to install VPSs with cPanel in a free server with centos 4, i tried with centos and fedora templates, but always i have problem with the perl compile the error is: fork Cannot Allocate Memory.

Can anyone post a HOWTO or the minimun setting to installs VPS with cPanel in a new server.

Thanks a lot

You hit limits, check /proc/user_beancounters to find out which one. I gues it's privmempages, am i correct?

Hi Hemry thanks for your quickly response!!

I think the error is in this line of memory

resource	held	maxheld	barrier	limit	failcnt
numproc	50	65	65	65	93

Now im going to change that, and by the way, what do u thinks y a good memory cantidad for a VPS with 10 GB and 256 MB of memory ??

Thanks in advance again!
