Subject: /proc/meminfo in VE
Posted by Josip Rodin on Thu, 29 May 2008 08:47:06 GMT

Hi,

When I converted a virtual machine from Xen to OpenVZ, I noticed that my meminfo-graphing scripts broke horribly :)

I figure most of those parameters are too hard to extract on a per-VE basis... right?

Hm, I just found that I have two machines running the same 2.6.24-ovz004 kernel, but the VE /proc/meminfo differs between the two - on one machine, there is one single VE on the machine, and that one sees all the data; while on the other machine, there are several VEs, yet none of them see the data.
