Hello everyone,

i've got the following problem, maybe someone can help:

At the moment i am using the following root:

Intel QuadCore 9300 / 8GB Ram / 750 GB HDD

Debian Etch 32 Bit

Kernel: 2.6.18-fza-028stab053.5-686-bigmern

vzctl version 3.0.22-1dso1

since days I try to install the 50th ve, but it just stops with the following error message:
failed to start with err=-11 / err=-12

by testing on the following hardware:

Intel Core2Duo 6300 / 4 GB Ram / 250 GB HDD

and Kernel 2.6.18-enterprise i was able to install the 50th ve.

I wanted to upgrade to that kernel on the quad core root, but I couldn't find it in apt-source

Did the support stop for that kernel?

How can I get more than 49 ves to start on the FZA kernel?

I hope someone can help me and maybe still got the debian packets of the enterprise version anywhere.

Regards,
neobsen

There is no such limit, the problem lies elsewhere.

Can you check /var/log/vzctl.log for more clues on what is happening?

failed to start with err=-11 / err=-12

I was not able to find such a phrase (neither "failed to start" nor "with err") in vzctl sources. Could you please specify the exact error message you get?
