Hi,
I'm just install openVZ in a Debian 4.0 32 bits.
I configured GRUB and my server run under openVZ kernel (with base of Debian).
This is the result of uname -a:

```
Linux gazzel 2.6.18-12-fza-686 #1 SMP Sun May 18 12:30:42 CEST 2008 i686 GNU/Linux
```

When I'm trying to create a new VE with the following command, I have this error:

Command:
vzctl create 101 --ostemplate debian-4.0-i386-minimal --config vps.basic

Error:
Unable to open /dev/vzctl: No such file or directory
Please check that vzdev kernel module is loaded and you have sufficient permissions to access the file.

I see the same error on the forum but the kernel wasn't loaded, but for me it is.

Somebody can help me ?

OpenVZ is started, please check :

```
# /etc/init.d/vz status
```

As asked by vzctl, check that vzdev is loaded:

```
/sbin/lsmdev | grep vzdev
```

Next, check that there is /dev/vzctl file:

ls -l /dev/vzctl

Report your results here

```
yum remove ovzkernel
yum install ovzkernel
nano /etc/grub.conf
default=0
shutdown -r now
/sbin/service vz start
yum install vzpkg vzyum vzrpm43-python vzrpm44-python vzctl-lib
vzctl create 1 --ostemplate centos-4-i386-minimal
```
