Subject: VE on GFS2

Hi,

we have two nodes with a clustered disk on san, with GFS2. The OS is RedHat 5 and we use the kernel 2.6.18-53.1.19.el5.028stab053.14ent.
When we start a VE, created on this GFS2 filesystem, the init boot process eats 100% of CPU and no more process are started on the VE. If we try to go in with vzctl enter command, give the error:
"Unable to open pty: Invalid argument"

Seems the same problem reported time ago in this thread
 http://forum.openvz.org/index.php?t=msg&goto=12876&& amp;srch=gfs2#msg_12876

But, if we try to create the same VE on a ext3 local filesystem, the VE goes perfect, without any problem.

There are some special configuration or drawback to run VE on GFS2 filesystems? any solution? Thanks

I have the same problem. You dont need a SAN to test it.
Just format a partition with GFS2 and create a VE on it.

However, I can mount a GFS2 volume somewhere inside the VE without problems.

Hi,
I have found a workaround for this problem until a clean   solution come.
If I mount the /dev directory on a ext3 filesystem, all problems gone!. Seems it's something related to the devices access on a GFS2 partition during the VE startup.
You could create a vps.mount in /etc/vz/conf with p.e.

#!/bin/bash
. /etc/vz/vz.conf
. $VE_CONFFILE

```
set -x
mount -n --bind /vzdev/$VEID/dev $VE_ROOT/dev
```

and copy a /dev directory from the original VE on gfs2 to /vzdev/$VE_ROOT on a ext3 filesystem.

Xavier
