
Subject: Debian / Ubuntu add_ip.sh scripts give problems

Hi, I'm using openvz with some debian / ubuntu containers, there is a problem with the debian-add_ip.sh script

It assigns the 127.0.0.1 ip to all the interfaces (at least with venet)

It is a big source of problems, like snmp dying after some minutes (version 5.4.1 and above) and other misterious things that might happen.

In the forum someone posted a modified script that corrects the mistake.

<http://forum.openvz.org/index.php?t=msg&th=817&start=0&>

Could any devel have a look at it and push something like that into the trunk?
