Hi,

I am new with openvz, but I learned a lot in several days.
What a great application, my compliments.

I have a small problem with vzyum.
I use CentOS 4.1 on my server. Openvz is correctly installed and I can make an VPS.

I also installed the vzyum-2.4.0-11.noarch.rpm.
The install is ok, but the command vzyum not recognised.
When I ask for it: which vzyum then it can nog be found.
However vzyum is installed because I see the /usr/share/vzyum map.

What am I doing wrong and how can I use the vzyum command to install extra software in the VPS?

Thanks for your help in advance.

you need to install vzpkg-2.7.0-18.noarch.rpm for it. After this, vzyum will be available as /usr/bin/vzyum
