I made a new template from a running server, it restarted it I guess and now when I try to ssh in after I enter the password my terminal freezes. I've tried on three machines so it's not the client, any idea?

Hi,

frankly speaking I don't understand you clearly.

Could you possibly answer some questions to clarify the situation:

- Quote:

it restarted it I guess and now when I try to ssh in after I enter the password my terminal freezes.

You have create a VE from a physical running server, haven't you?

Then you have been able to start your VE, haven't you? (vzctl start). Then you set an IP address for your VE and try to connect to it via ssh. Am I right? But it was impossible.

- Quote:

I've tried on three machines so it's not the client, any idea?

What does it mean?

- Could you possible provide us a link where we can download problem template to try using it.
