Who would I ask about getting the AppleTalk module built in the normal openvz kernel? I know I can build a whole new kernel but it would be great to just be able to update with normal openvz community kernel.

Does anyone know how I can just build that module for the current one? I have everything needed but get an error when I load it about an unknown swmbol.

Thanks,
Paul

You can recompile the kernel using these instructions:
http://wiki.openvz.org/Kernel_build#Rebuilding_kernel_from_SRPM
