Subject: not loading vznetdev unexpected side effects
Posted by piavlo on Tue, 22 Jul 2008 20:45:06 GMT

Hi,
I'm using only veth* devices so,
in order to get rid of venet* interfaces for good both in VE0 and VEs i avoided vznetdev module
from loading. Now the venet* devices are not created, as i want. The VEs themselfs are starting
and working ok. But /proc/vz/veinfo is absent both on VE0 and VEs
and vzctl does not report VE states correctly, in spite of that it starts and stops ve correctly.
 For example both kdc1 and vzimg-dmz VEs are running ok but
vzctl reports them as mounted and complains about /proc/vz/veinfo absence
ovz1 ~ # vzlist -an
Unable to open /proc/vz/veinfo
```
    VEID     NPROC STATUS  IP_ADDR        NAME
    101        - mounted -        kdc1
    1000        - mounted -         vzimg-dmz
```
ovz1 ~ #

So why unloading vznetdev also removes unrelated /proc/vz/veinfo proc entry?

Using openvz-028stab053-r14 on gentoo

Thanks
Alex
