Hello
I'm running few HNs with CentOS 5 and openvz kernels. My Question is what are suggested best practices to keep the HNs up-to-date with respect to lastest package releases and OpenVZ kernel releases. Should I first update the base CentOS kernel and it's packages and then OpenVZ Kernel? I'm more familiar with Debian's apt-get than yum. What's the best way to keep the HNs (and VPS'es which are running Ubuntu templates) uptodate?

Thanks for your suggestions.

Hi,

I think the order is not important.
