VE start in progress...

After I do this and try to get into the system, I no longer can as it gives me a fork: out of memory error, and HyperVM shows that the server is in an offline without-memory state.

I had the DC change eth0 and eth1 around, as I was getting an "arpsend WARNING" issue instead of the new "vps-net_add WARNING"

This only happens on my newest machine; all of the other 3 I can make a VPS with the exact same IPs and they work 100% fine; I can reboot without seeing this error

I need this fixed ASAP

Edit: Fairly new system, Centos 5.2 64bit; not sure on the OpenVZ version though, no clue how to check >.<

Edit again: If I remove the IPs from the specified VPS, reboot the VPS; THEN add the IPs then the server works just fine and the IPs work; the VPS only won't work when I try to reboot it.

Hello.

Quote:I no longer can as it gives me a fork: out of memory error
If you get out of memory failures - check failcounters in /proc/user_beancounters file and resolve them if any.

Quote:arpsend: 69.162.73.104 is detected on another computer : 00:14:1c:1d:67:80
vps-net_add WARNING: arpsend -c 1 -w 1 -D -e 69.162.73.104 eth1 FAILED
Can you just ping the address in question while the VE is down? If it's pingable - you'll have to resolve the IP duplication.
Just check the node with MAC 00:14:1c:1d:67:80 - arpsend reported that the address is used on it (probably on some it's VE).

We have already checked and the IPs are not in use. I edited my post above to explain how I can get it to work; check that then see if you know what may have caused this.

And what is the node with MAC 00:14:1c:1d:67:80?
Is that the same node where you are trying to restart VE or another node?

The DC won't tell me which it is so I do not know.

Now I think that this newer node is on a different router, and I have IP pooling so I think it is trying to go through the wrong router to the VPS...

The weird part is when I go to stop the VZ it takes like 3-5 minutes just to stop.

Is there any way to re-install OpenVZ without having to move the 11 VPS clients off of the node or without loosing data? I think the best bet may be to just re-install

1) you can check if that MAC belongs to YOUR node and if not - then another physical node has this MAC.
2) you can check your arp table - probably it'll have needed entry.

<Myself> I think one of the files may have been corrupt wile installing but the installer didnt catch it
<lx_lxsales> in that case, do rpm -e vzctl
<lx_lxsales> yum -y install vzctl

I ran the re-install of vzctl and it worked :D:D:D:D:D:D

Well, my congratulations!
At the same time such a 'corruption' seems strange to me. Just in case - next time you can check

---

if all files from rpm are ok/not corrupted by 'rpm -V <package>'.
